## Differential Pressure Transmitters

Differential pressure transmitters are sophisticated instruments used to measure the difference in pressure between two points or across a device or system. The sensing element detects the pressure difference, and the transmitter converts it into an electrical signal, which is then transmitted and utilized for monitoring, control, or data acquisition purposes, commonly used in filter monitoring, hydraulic, flow, water/waste water applications, as well as factory or pneumatic air, pitot tubes, air speed and other industrial applications. The solid state silicon core and all stainless steel wetted parts provide long, reliable service life with excellent long term stability.
